

Security Models: Past, Present and Future

Prof. Ravi Sandhu
Executive Director and Endowed Chair
Institute for Cyber Security
University of Texas at San Antonio
July 2010

ravi.sandhu@utsa.edu
www.profsandhu.com

THE BIG PICTURE

We are at an inflection point

- “Now we face a new challenge to security, a world of shared computing and web services. As with radio, this technology is too valuable to go unused, By contrast with radio, which could be protected with cryptography, there may be no technology that can protect shared computation to the degree we would call secure today. In a decade or a generation, there may be no secure computing.”

Need to be realistic in our security expectations

- Computer scientists could never have designed the web because they would have tried to make it work.

But the Web does “work.”

What does it mean for the Web to “work”?

- Security geeks could never have designed the ATM network because they would have tried to make it secure.

But the ATM network is “secure.

What does it mean for the ATM network to be “secure”?

- Information needs to be protected
 - In motion
 - At rest
 - In use
- Absolute security is impossible and unnecessary
 - Trying to approximate absolute security is a bad strategy
 - “Good enough” security is feasible and meaningful
 - Better than “good enough” is bad
- Security is meaningless without application context
 - Cannot know we have “good enough” without this context
- Models and abstractions are all important
 - Without a conceptual framework it is hard to separate “what needs to be done” from “how we do it”

We are not very good at doing any of this

- Our Basic Premise
 - There can be no security without application context
 - Courtney's Law (1970s, 1980s ??):
 - You cannot say anything interesting (i.e. significant) about the security of a system except in the context of a particular application and environment
- Corollary
 - There can be no security model without application context
- Reality
 - Existing security models are application neutral
 - Assumption is they can be readily “configured” or “policy-fied” to suit application context

There is also a notion of technology context for security models but out of scope for this lecture

Software-Architect	Project	% Time	Label
Alice	Vista	25%	U
Alice	SecureVista	75%	S
Bob	XP	100%	U

- What precisely is Secret?
 - There exists a SecureVista project
 - Alice works on SecureVista
 - Alice's effort on SecureVista is 75%
 - All or some of the above
- How do we maintain integrity of the database?
 - Depends

Much work and \$\$\$ by researchers and vendors, late 80's-early 90's

Emerging Application-Centric Era (ACE)

ECE
Enterprise-Centric Era

ACE
Application-Centric Era

Applications are cyber analogs of previously existing enterprise-centric applications

- on-line banking
- brokerage
- e-retail
- auctions
- search engines

Future applications will be fundamentally different

- ?
- ?
- ?
- ?

PEI Models: 3 Layers/5 Layers

This lecture is focused on the policy models layer

At the policy layer security models are essentially access control models

THE PAST

- Discretionary Access Control (DAC)
 - Owner controls access but only to the original, not to copies
- Mandatory Access Control (MAC)
Same as Lattice-Based Access Control (LBAC)
 - Access based on security labels
 - Labels propagate to copies
- Role-Based Access Control (RBAC)
 - Access based on roles
 - Can be configured to do DAC or MAC

ACCESS CONTROL LISTS (ACLs)

F

U:r
U:w
U:own

G

U:r
V:r
V:w
V:own

each column of the access matrix is stored with
the object corresponding to that column

U **F/r, F/w, F/own, G/r**

V **G/r, G/w, G/own**

each row of the access matrix is stored with the
subject corresponding to that row

Subject	Access	Object
U	r	F
U	w	F
U	own	F
U	r	G
V	r	G
V	w	G
V	own	G

**commonly used in relational
database management systems**

TROJAN HORSE EXAMPLE

ACL

File F

A:r
A:w

File G

B:r
A:w

B cannot read file F

TROJAN HORSE EXAMPLE

B can read contents of file F copied to file G

- Traditional DAC does not prevent copies from being made and there is no control over copies
 - Modern approaches to information sharing and trusted computing seek to maintain control over copies
- Traditional DAC is weak with respect to confidentiality but may have value with respect to integrity

SIMPLE-SECURITY

Subject S can read object O only if

- $\text{label}(S)$ dominates $\text{label}(O)$

STAR-PROPERTY (LIBERAL)

Subject S can write object O only if

- $\text{label}(O)$ dominates $\text{label}(S)$

STAR-PROPERTY (STRICT)

Subject S can write object O only if

- $\text{label}(O)$ equals $\text{label}(S)$

**Hierarchical
Classes with
Compartments**

product of 2 lattices is a lattice

**Hierarchical

O: System Code
in Development

O: Repair Code

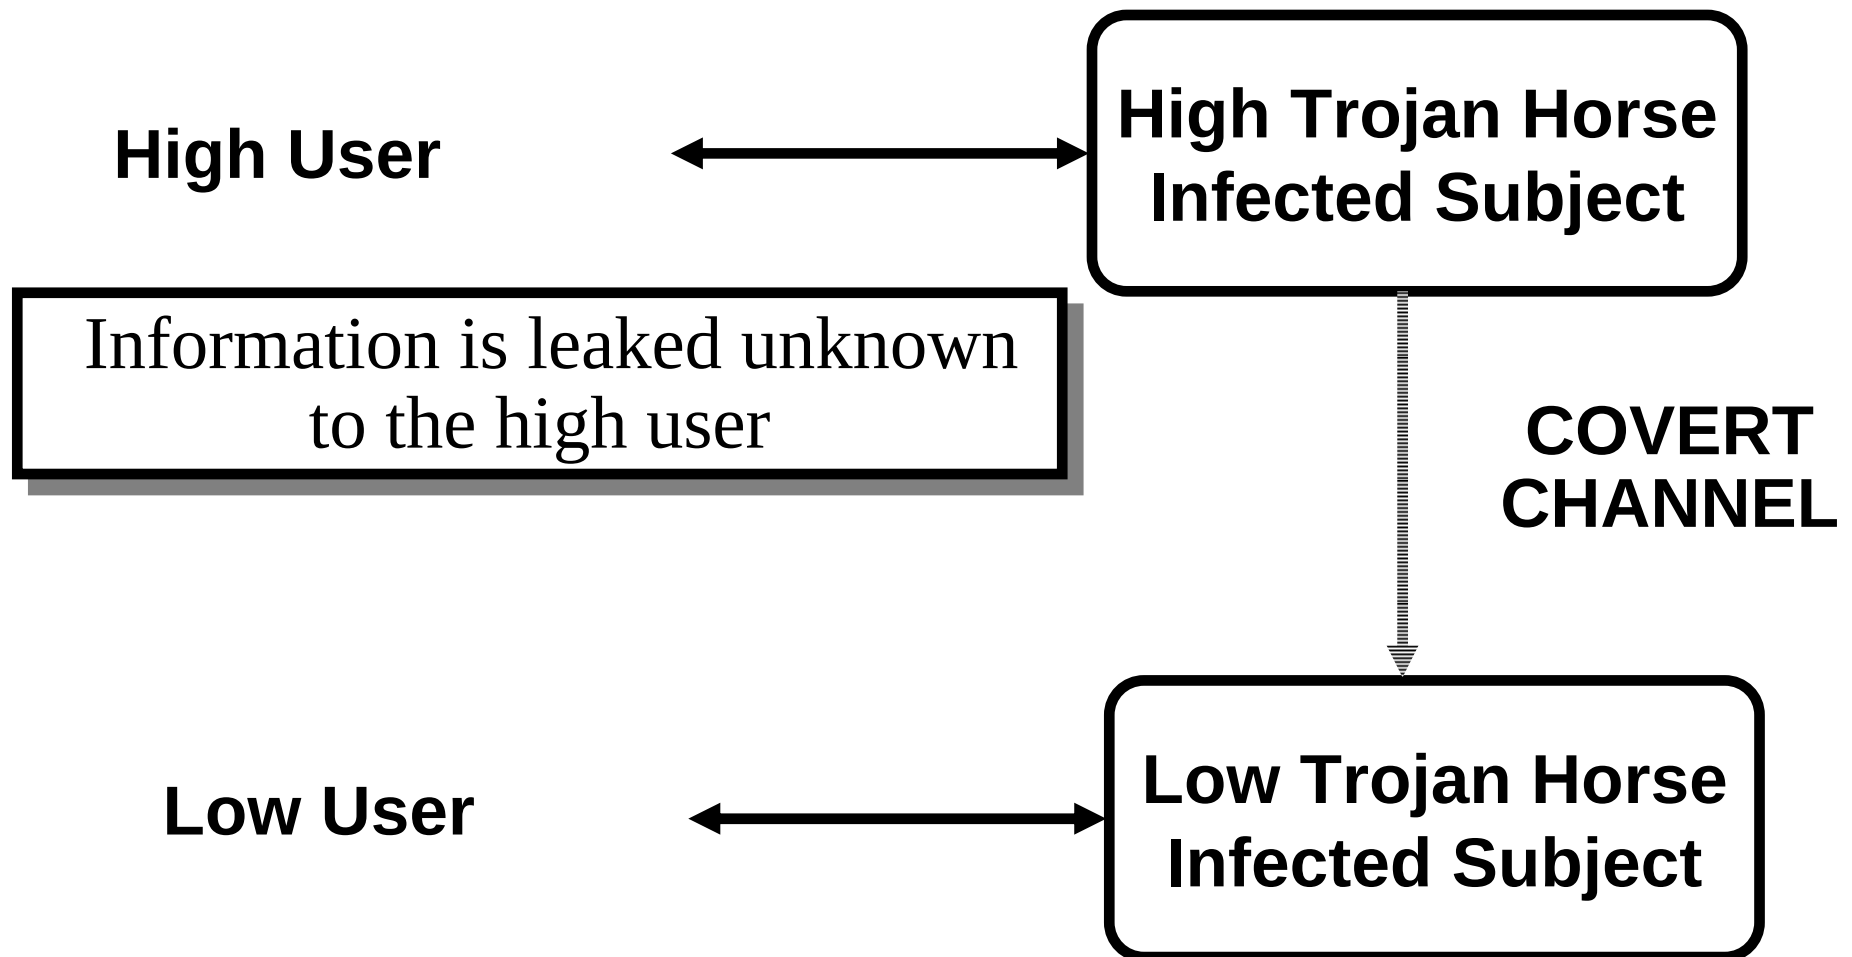

O: Production Code

O: Tools

O: System Programs

- LBAC fails to control covert channels
- LBAC fails to control inference and aggregation
- It is too rigid for most commercial applications
- It has strong mathematical foundations

- Access is determined by roles
- A user's roles are assigned by security administrators
- A role's permissions are assigned by security administrators

Is RBAC MAC or DAC or neither?

First emerged: mid 1970s
First models: mid 1990s

- RBAC can be configured to do MAC
- RBAC can be configured to do DAC
- RBAC is policy neutral

RBAC is neither MAC nor DAC!

ROLE HIERARCHIES

ROLE HIERARCHIES

THE PRESENT

- Discretionary Access Control (DAC)
 - Owner controls access but only to the original, not to copies
- Mandatory Access Control (MAC)
Same as Lattice-Based Access Control (LBAC)
 - Access based on security labels
 - Labels propagate to copies
- Role-Based Access Control (RBAC)
 - Access based on roles
 - Can be configured to do DAC or MAC
- Attribute-Based Access Control (ABAC)
 - Access based on attributes, to possibly include roles, security labels and whatever

- **Abstraction** of Privileges
 - Credit is different from Debit even though both require read and write
- **Separation** of Administrative Functions
 - Separation of user-role assignment from role-permission assignment
- **Least Privilege**
 - Right-size the roles
 - Don't activate all roles all the time
- **Separation of Duty**
 - Static separation: purchasing manager versus accounts payable manager
 - Dynamic separation: cash-register clerk versus cash-register manager

- **Abstraction** of Privileges
 - Credit vs debit
 - Personalized permissions
- **Separation** of Administrative Functions
- **Containment**
 - Least Privilege
 - Separation of Duties
 - Usage Limits
- **Automation**
 - Revocation
 - Assignment: (i) Self-assignment, (ii) Attribute-based
 - Context and environment adjustment
- **Accountability**
 - Re-authentication/Escalated authentication
 - Click-through obligations
 - Notification and alerts

Security Objectives

Security Architectures

- unified model integrating
 - authorization
 - obligation
 - conditions
- and incorporating
 - continuity of decisions
 - mutability of attributes

- DAC
- LBAC
- RBAC
- ABAC
- ... and many, many others
- UCON
 - ABAC on steroids
 - Simple, familiar, usable and effective use cases demonstrate the need for UCON
 - Automatic Teller Machines
 - CAPTCHAs at Public web sites
 - End User Licence Agreements
 - Terms of Usage for WiFi in Hotels, Airports
 - Rate limits on call center workers

THE FUTURE

- Our Basic Premise
 - There can be no security model without application context
- So how does one customize an application-centric security model?
 - Meaningfully combine the essential insights of
 - DAC, LBAC, RBAC, ABAC, UCON, etcetera
 - Directly address the application-specific trade-offs
 - Within the security objectives of confidentiality, integrity and availability
 - Across security, performance, cost and usability objectives
 - Separate the real-world concerns of
 - practical distributed systems and ensuing staleness and approximations (enforcement layer) from
 - policy concerns in a idealized environment (policy layer)

PEI Models: 3 Layers/5 Layers

This lecture is focused on the policy models layer

Dissemination-Centric Sharing

- Extensive research in the last two decades
 - ORCON, DRM, ERM, XrML, ODRL, etc.
- Copy/usage control has received major attention
- Manageability problem largely unaddressed

Dissemination Chain with Sticky Policies on Objects

Group-Centric Sharing (g-SIS)

- Brings users & objects together in a group
 - Focuses on manageability using groups
 - Co-exists with dissemination-centric
 - Two metaphors
 - Secure Meeting Room (E.g. Program committee)
 - Subscription Model (E.g. Secure multicast)
- Operational aspects
 - Group characteristics
 - E.g. Are there any core properties?
 - Group operation semantics
 - E.g. What is authorized by join, add, etc.?
 - Read-only Vs Read-Write
- Administrative aspects
 - E.g. Who authorizes join, add, etc.?
 - May be application dependant
- Multiple groups
 - Inter-group relationship

g-SIS Operation Semantics

g-SIS Operation Semantics

Family of g-SIS Policy Models

Subject Model

Object Model

g-SIS models: (e) X (f)

Traditional Groups: <LJ, SL, LA, SR>
Secure Multicast: <SJ, LL, LA, *>

Most Restrictive
g-SIS Specification:

$$\Box(\text{Authz} \leftrightarrow (\neg \text{SR} \wedge \neg \text{SL}) \mathcal{S} (\text{SA} \wedge (\neg \text{SL} \mathcal{S} \text{SJ})))$$

g-SIS Enforcement Model

Subject Attributes: {id, Join-TS, Leave-TS, ORL, gKey}

ORL: *Object Revocation List*
gKey: *Group Key*

Object Attributes: {id, Add-TS}

Refresh Time (RT): TRM contacts CC to update attributes

- Additional Trusted/Semi-Trusted Servers
- Approximate Enforcement
- Finally, the Implementation layer models spell out protocol details and details of TRM algorithms

CONCLUSION

THE PAST

- Discretionary Access Control (DAC)
- Mandatory Access Control (MAC)
 - Equivalently Lattice-Based Access Control (LBAC)
- Role-Based Access Control (RBAC)

THE PRESENT

- Usage Control (UCON)
 - Attribute-Based Access Control (ABAC) on steroids

THE FUTURE

- Application-Centric Access Control Models
- Technology-Centric Access Control Models

Models are all important
A Policy Language is not a substitute for a good model
